ACKNOWLEDGMENTS

I would like to thank, first and foremost, my advisor, Dr. John Horel, for his guidance and support throughout my graduate career and during the completion of this thesis. I am also extremely grateful to the members of my committee, Dr. Jan Paegle and Dr. W. James Steenburgh, for their input and interest in this research.

Special thanks go to Michael Splitt for his comments and help with the observed precipitation data, to Dr. Brett McDonald for providing NCEP model data, to Dr. Daryl Onton for his input and general assistance, and to Dr. David Schultz for his advice and encouragement. I am also grateful to Bryan White, whose hard work maintaining the computer systems allowed for a smooth computing experience.

I would like to acknowledge the students and other staff members in the Department of Meteorology, especially the graduate students in my entering class, Tom "Captain Synoptikos" Blazek, who taught me a lot about weather analysis and forecasting, and Craig Clements, who pestered me to study mountain meteorology and who taught me how to be cool (well, maybe not). Also, thanks to Ralph Patterson for teaching me to ski, an activity that has allowed me to better appreciate wintertime precipitation in the Salt Lake City area.

Thanks also to my family for supporting me in my educational pursuits and to my friends for their encouragement. I am particularly indebted to five guys whose creative endeavors allowed me to maintain my (in)sanity throughout the writing of this thesis, Al

Yankovic and his band.
